The Internet of things (IoT) describes physical objects (or groups of such objects) with sensors, processing ability, software and other technologies **that** connect and exchange data with other devices and systems over the Internet or other communications networks. Internet of things has been considered a misnomer (nombre equivocado) because devices do not need to be connected to the public internet, **they** only need to be connected to a network, and be individually addressable.

The field has evolved **due to** the convergence of multiple technologies, including ubiquitous computing, commodity sensors, increasingly powerful embedded systems, as well as machine learning. Traditional fields of embedded systems, wireless sensor networks, control systems, automation (including home and building automation), independently and collectively enable the Internet of things. In the consumer market, IoT technology is most synonymous with products pertaining to the concept of the "smart home", including devices and appliances (such as lighting fixtures, thermostats, home security systems, cameras, and other home appliances) that support one or more common ecosystems, and can be controlled via devices associated with that ecosystem, **such as** smartphones and smart speakers. IoT is also used in healthcare systems.

There are a number of concerns about the risks in the growth of IoT technologies and products, especially in the areas of privacy and security, and consequently, industry and governmental moves to address these concerns have begun, including the development of international and local standards, guidelines, and regulatory frameworks

The concept of the "Internet of things" and the term **itself**, first appeared in a speech by Peter T. Lewis, to the Congressional Black Caucus Foundation 15th Annual Legislative Weekend in Washington, D.C., published in September 1985. According to **him**, "The Internet of Things, or IoT, is the integration of people, processes and technology with connectable devices and sensors to enable remote monitoring, status, manipulation and evaluation of trends of such devices."

The term "Internet of things" was coined independently by Kevin Ashton, in 1999, though **he** prefers the phrase "Internet for things". At that point, he viewed radio-frequency identification (RFID) as essential to the Internet of things, which would allow computers to manage all individual things. The main theme of the Internet of things is to embed short-range mobile transceivers in various gadgets and daily necessities to enable new forms of communication between people and things, and between things **themselves**.

In 2004 Cornelius "Pete" Peterson, CEO of NetSilicon, predicted that, "The next era of information technology will be dominated by [IoT] devices, and networked devices will ultimately gain in popularity and significance to the extent that they will far exceed the number of networked computers and workstations." Peterson believed that medical devices and industrial controls would become dominant applications of the technology.

Defining the Internet of things as "simply the point in time when more 'things or objects' were connected to the Internet than people", Cisco Systems estimated that the IoT was "born" between 2008 and 2009, with the things/people ratio growing from 0.08 in 2003 to 1.84 in 2010.

Apellido y Nombre:……Legajo:……Curso:……

1) <u>Responder las siguientes preguntas en ESPAÑOL</u>.

   - ¿Cuáles son las preocupaciones respecto al crecimiento de productos y tecnologías de IoT?

2) <u>Traducir los siguientes fragmentos al ESPAÑOL.</u>

   - Processing ability
   - Increasingly powerful embedded systems
   - The concept of the “smart home”
   - Short-range mobile transceivers

3) Referencia contextual. Indicar a qué o quién hacen referencia las siguientes palabras o frases.

   - That (línea 2) : _____
   - They (línea 4) : _____
   - Itself (línea 17) : _____
   - Him (línea 19) : _____
   - He (línea 22): _____
   - Themselves (línea 26): _____

4) Completar el siguiente cuadro de conectores en ESPAÑOL.

CONECTOR	TRADUCCIÓN	TIPO DE RELACIÓN	IDEA UNO	IDEA DOS
Due to (línea 6)				
Such as (línea 12)				

RESUELTO

Modelo de parcial · Internet de las cosas

Las respuestas van en azul. Las consignas son las mismas de las hojas anteriores.

1) Responder las siguientes preguntas en ESPAÑOL.

• ¿Cuáles son las preocupaciones respecto al crecimiento de productos y tecnologías de IoT?
→ Los riesgos en la privacidad y en la seguridad. Por eso la industria y los gobiernos empezaron a desarrollar normas internacionales y locales, guías y marcos regulatorios.

2) Traducir los siguientes fragmentos al ESPAÑOL.

• Processing ability
→ Capacidad de procesamiento.

• Increasingly powerful embedded systems
→ Sistemas embebidos cada vez más potentes.

• The concept of the “smart home”
→ El concepto de «casa inteligente».

• Short-range mobile transceivers
→ Transceptores móviles de corto alcance.

3) Referencia contextual. Indicar a qué o quién hacen referencia las siguientes palabras o frases.

• That (línea 2)
→ physical objects: los objetos físicos (con sus sensores, su software y otras tecnologías), que son los que se conectan e intercambian datos

• They (línea 4)
→ devices (los dispositivos)

• Itself (línea 17)
→ the term «Internet of things» (el término)

• Him (línea 19)
→ Peter T. Lewis

• He (línea 22)
→ Kevin Ashton

• Themselves (línea 26)
→ things (las cosas)

4) Completar el siguiente cuadro de conectores en ESPAÑOL.

Conector	Traducción	Tipo de relación	Idea uno	Idea dos
Due to (línea 6)	debido a	causa	El campo (de la IoT) evolucionó.	La convergencia de múltiples tecnologías.
Such as (línea 12)	como / tales como	ejemplificación	Dispositivos asociados a ese ecosistema.	Teléfonos inteligentes y parlantes inteligentes.
